Differences between Stand-Alone Version and Network Version

In terms of license management & license number, we provide two versions of the program --- Stand-Alone Version & Network Version.

Definition

Stand-Alone Version:

Each license is bound to a single user and computer.

Stand-alone licenses are ideal for small offices and dedicated production users, because they do not require network connection to run.

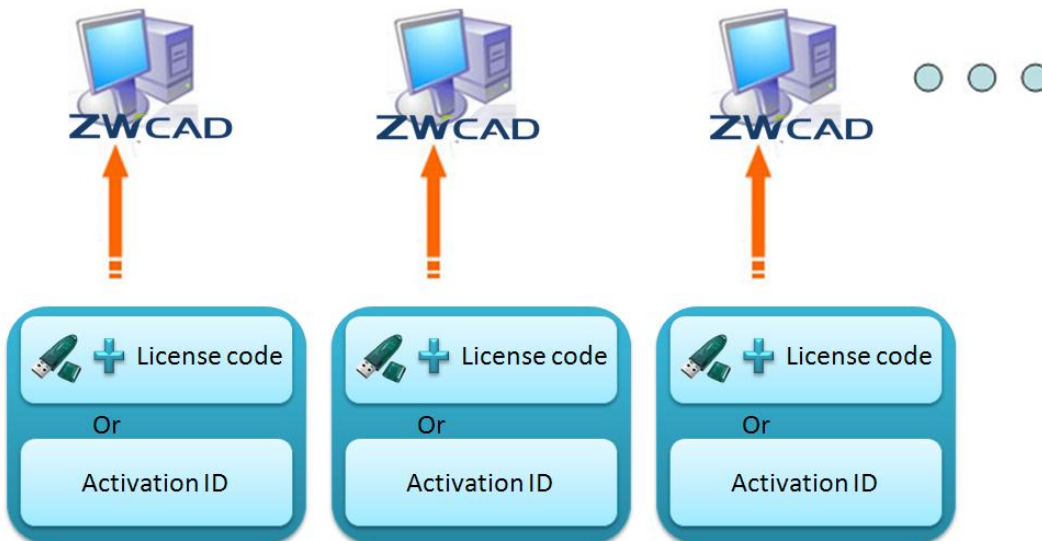

Network Version:

Multiple copies for a license, and a license manager should be installed on the server which is meant to manage the licenses. Workstations can get floating licenses (or borrow licenses) from the authorized server.

Comparing Table

Type		Description	Floating License	Borrow	Deployment
Stand-Alone	Dongle	One copy per License	N	N	N
	Soft Key				
Network	Dongle	Multiple copies per License	Y	N	Y
	Soft Key	Multiple copies per License	Y	Y	Y

• Stand-alone Version

• Network Version
